ART FIBER SYSTEMS CHALLENGE · SCHUBKI NATIONAL AI HACKATHON 2026

AFS Spectroscopy Assistant

A customer enquiry goes in. A cited first technical assessment comes out.

Team Helios

REPO_URL_PENDING

WHAT WE BUILT

Ask in plain words. Get a cited answer.

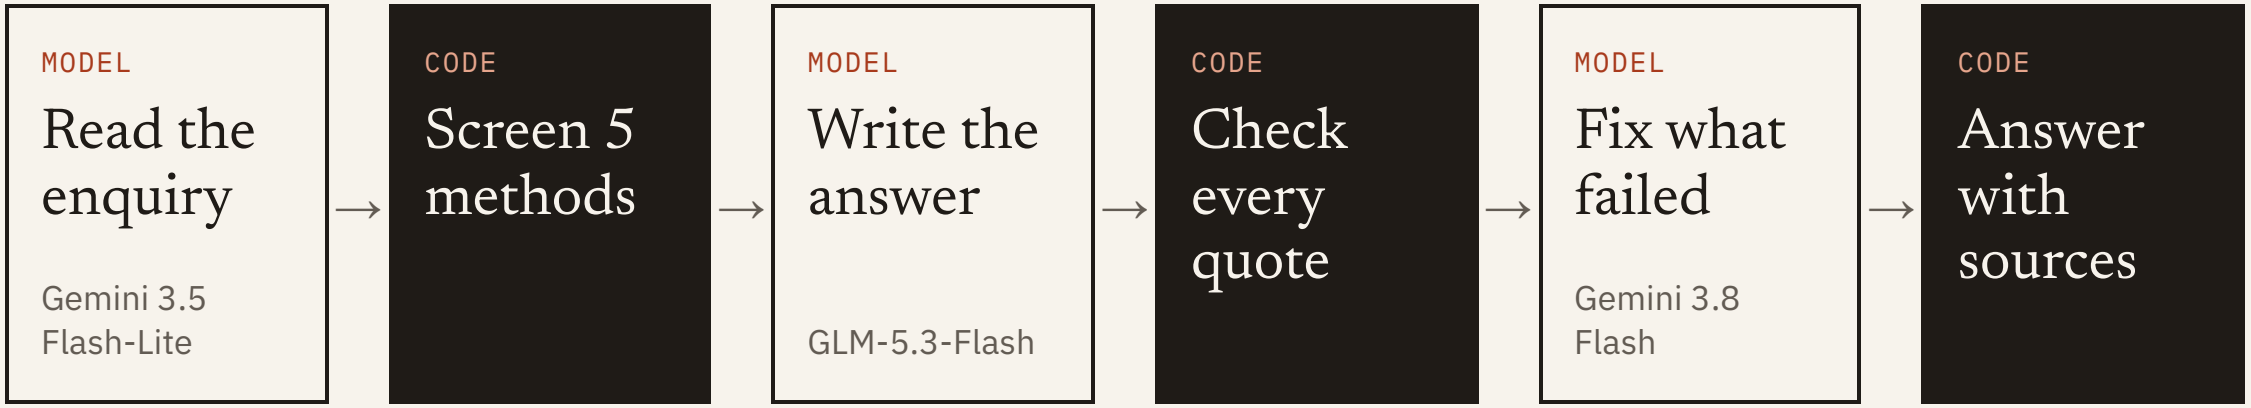

- Recommends the method and probe to test first.
- Every key claim cites the AFS page it comes from.
- Asks only the questions that would change the advice.
- Follow-ups in seconds; new facts update the answer.

Screenshot: the real app, evaluation case H04 (outputs/final/H04.json), unedited

SYSTEM ARCHITECTURE

Models write. Code checks.

Three models, each on its own job. In a blind test of 7 setups, this mix was **3–6× faster** at close to the best quality, about **$0.03** per case.

USE OF AFS MATERIALS

Built on the AFS documents

67

AFS pages the model reads

44

rules from the AFS documents, each tied to a quote

120/120

quotes found word for word on the cited page, in the six evaluation cases

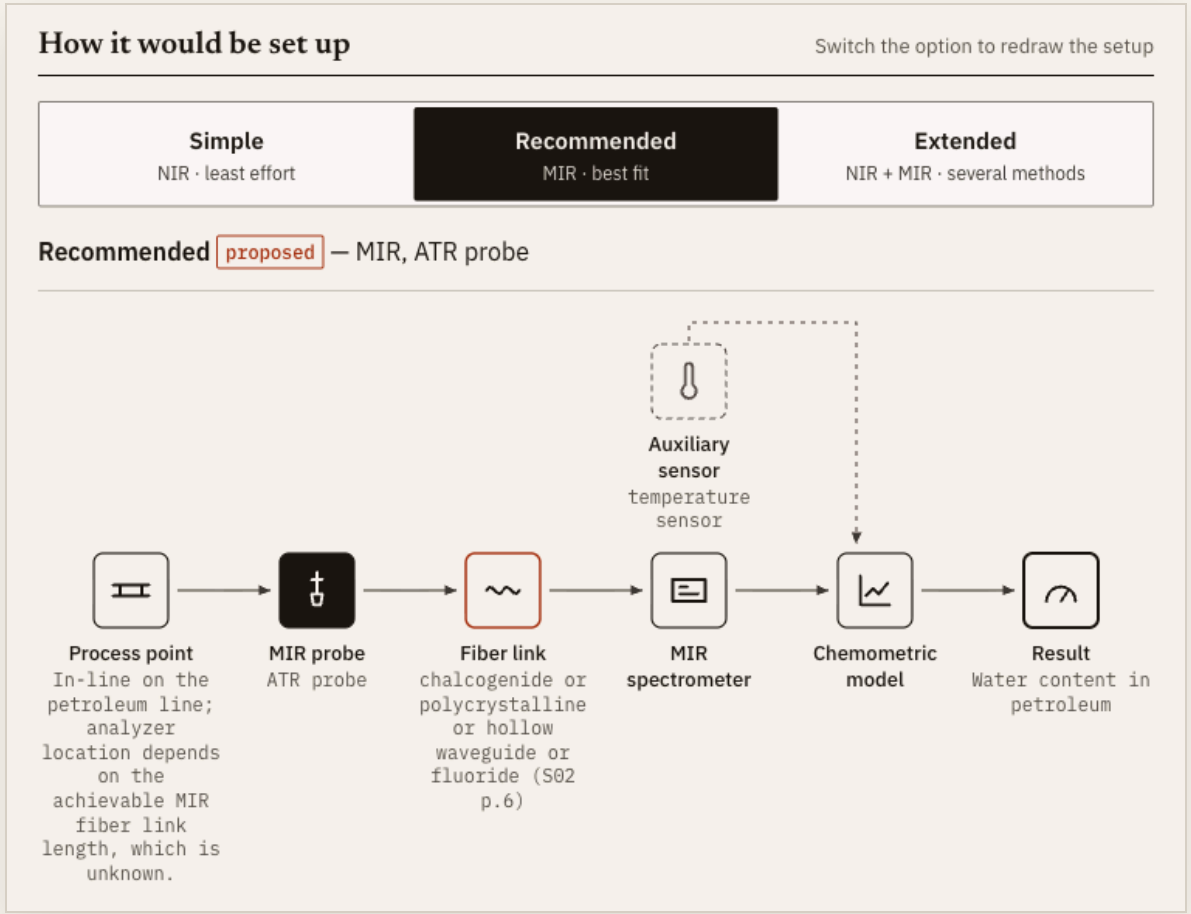

Code checks every quote against its page. Anything unsupported is removed or labelled.

EXAMPLE RECOMMENDATION · EVALUATION CASE H04, UNEDITED

“Can we reuse our silica cable for mid-IR?”

THE AGENT’S ANSWER

Not as asked: silica fibers cannot carry mid-IR light. Test MIR ATR with a CIR or PIR fiber.

Screenshot: the real app, outputs/final/H04.json

EXAMPLE FEASIBILITY-STUDY PLAN · SAME CASE, UNEDITED

It asks, then plans the first test

QUESTIONS FOR THE CUSTOMER

Help us sharpen this

3 answers would change the advice. Pick a question to fill in the customer's answer.

1 What is the actual link length and routing between the petroleum line and the analyzer building?

2 What is the physical state and condition of the petroleum at the measurement point (liquid, viscous, opaque, temperature, fouling)?

3 What water-content range, accuracy and response time does the investigation require?

Update the recommendation

Takes a few minutes; the new answer appears below with what changed.

FIRST FEASIBILITY TEST

First feasibility test

5 steps

1. **Collect representative petroleum samples spanning the expected water-content range and physical variation (temperature, opacity, phase).** Ensure the calibration space covers real line conditions.
2. **Measure each sample with a laboratory MIR ATR setup (ZrO2 or diamond ATR tip) using a CIR/PIR fiber probe.** Establish whether MIR ATR spectra distinguish the water levels of interest. S02 p.13
3. **Obtain independent reference water-content values for every sample by a laboratory method (e.g. Karl Fischer titration).** Provide the ground truth for calibration and validation.
4. **Build and validate a chemometric calibration on held-out samples; if MIR ATR alone falls short of the target, test the MIR+NIR combination against the best single method.** Quantify achievable accuracy and decide whether fusion adds value. S01 p.5
5. **Confirm the achievable MIR fiber link length with AFS before fixing the analyzer location; define go/no-go criteria (accuracy, detection limit, response time) with the customer.** The remote-analyzer concept depends on a link length no source specifies.

Reference measurements	Karl Fischer titration or an equivalent laboratory water-in-oil method, supplied by the customer.
Decision basis	Go/no-go criteria (required accuracy, detection limit, response time) to be defined numerically by the customer; the plan proceeds only if the MIR link length is confirmed feasible.

RESULTS

Six evaluation cases, answered by the agent

Reuse an NIR calibration on a new blend?

Not supported. Rebuild the calibration.

A clear and an opaque dairy stream?

Provisional. A different NIR probe for each.

Fluorescence for glucose?

Not supported. Test Raman first.

Silica cable for mid-IR?

Not supported. Use a CIR or PIR fiber.

Unknown contaminant, sensor now?

Not enough information. Lab trial first.

A kidney study as proof for surgery?

Not supported. Test on own tissue first.

120/120 quotes verified **1.5–3** min per case **$0.29** for all six

outputs/final/H01–H06 (.md, .json, brief/) · run once, not edited

LIMITATIONS

Limitations and next steps

Full answers are long (~3,000 words)	→ A short customer reply
A quote on the page is not yet proof	→ A second checker for support
Confidence is mostly “Low”	→ Confidence that tracks the facts
A run takes 1.5–3 minutes	→ A faster fixing step
